Committed to Sustainability.
Armstrong Flooring is committed to delivering solutions that reduce the environmental impact of the buildings you create, from product design and raw material selection, to how our products are produced and delivered.

This Environmental Product Declaration (EPD) was developed to document the sustainability of our products. Inside this ASTM certified ISO compliant EPD is the following:

- Product application and use
- Product ingredients and their sources
- Information on how LVT flooring is produced
- Life Cycle Assessment (LCA) results including global warming potential and primary energy usage
- Total impacts over the life cycle of the product
- Performance attributes

LVT is designed to be durable, beautiful and easy to install, making it a great product for commercial applications.

Luxury Flooring (LVT)
According to ISO 14025 and ISO 21930

Visit ArmstrongFlooring.com for further information.
This document is a Type III Environmental Product Declaration by Armstrong Flooring, Inc. that is certified by ASTM as conforming to the requirements of ISO 14025 and ISO 21930. ASTM has assessed that the Life Cycle Assessment (LCA) information fulfills the requirements of ISO 14040 and ISO 14044 in accordance with the instructions listed in the product category rules cited below. The intent of this document is to further the development of environmentally compatible and sustainable construction methods by providing comprehensive environmental information related to potential impacts in accordance with international standards.

Declaration Number: EPD-0004  
Program Operator: Armstrong Flooring, Inc. - 2500 Columbia Avenue, Lancaster, PA 17603  
Declaration Holder: Armstrong Flooring, Inc. - 2500 Columbia Avenue, Lancaster, PA 17603

Declared Product
Armstrong Flooring Natural Creations®, Natural Creations® with I-Set®, Parallel® 20, and Parallel® 12 captures the essence of earth’s woods, stones, metals and textile designs in a wide array of tile and plank sizes. Commercial LVT combines the best of durability, ease of installation, and design to give you the look and performance you expect. Armstrong Flooring LVT is FloorScore® Certified.

Declaration Type
Cradle-to-Grave. Intended for Business-to-Business (B-to-B) audiences. Represents Average Performance.

Applicable Countries

Product Application
Floor covering choice in commercial spaces:
- Hospitality
- Education
- Healthcare
- Office
- Retail
- Assisted Living

Content of the Declaration
This declaration is complete and contains in its full form:

ASTM certification of this EPD is not to be construed as representing aesthetics or any other attributes not specifically addressed, nor should it be construed as an ASTM endorsement of the subject of the EPD or a recommendation for its use. There is no warranty by ASTM, express or implied, as to any finding or other matter in the EPD, or as to any product covered by the EPD. The EPD holder is liable for the information and evidence on which the EPD is based.
Summary LCA Results

Scope and Boundaries of the Life Cycle Assessment

The Life Cycle Assessment (LCA) was performed according to ISO 14040 and followed the PCR instructions. The cradle-to-grave LCA encompasses raw material production; transport of raw materials to the production facility; manufacturing of flooring; packaging; transportation to job site; use phase; and end of life including disposal or recycling. Detailed information regarding the LCA is found in Section 10.

¹ Additional Impact Measures are included in Section 10.
² Impact as based on CML 2001-Nov. 2010.
³ Use stage impacts are based on medium intensity maintenance practices as described in Section 7.

Additional Information

This declaration contains additional information, as listed below, that is outside the scope of the LCA. This additional information, provided by Armstrong Flooring, has not been evaluated by ASTM, but is considered useful for the purpose of comparing this EPD to other EPDs developed from the same PCR. Guidance is recommended in comparing performance data and LCA information for products that perform the same in the areas of Acoustics, Stain Resistance, Light Reflectance, Durability, Maintenance and End of Life Recyclability. Please refer to page 4 for a summary of performance attributes by item number and note the website references listed below for additional information.

- Resistance to Staining and Reagents: ArmstrongFlooring.com/stainresistance
- Health, Safety, and Installation Information: ArmstrongFlooring.com/LVT
Detailed LCA Results

1.0 Product Definition

1.1 Product Definition and Description
Armstrong Luxury Flooring captures the essence of earth’s woods, stones, metals and original graphic designs in a wide array of tile and plank sizes. Commercial LVT combines the best of durability, technology, and design to give you the look and performance you expect. The durable, abrasion-resistant wear layer allows for years of good looks while the UV-cured urethane coating provides low-maintenance options and may eliminate the need for polishes in some areas.

2.0 Product Application
Armstrong Luxury Flooring is a commercial interior floor covering. To achieve consistent, high-quality installation of all products in our flooring portfolio, we have created the Armstrong Flooring Guaranteed Installation Systems manual, F-5061. This comprehensive guide to our flooring installation provides all the information needed to properly install Armstrong Flooring LVT and ensure it will look great and perform exactly as it should. This document can be referenced at: https://www.armstrongflooring.com/commercial/en-us/resources/guaranteed-installations-systems-manual-F-5061.html

3.0 Product Performance Attributes
All Armstrong Luxury Flooring meets or exceeds the performance requirements of ASTM F 1700, Standard Specification for Solid Vinyl Floor Tile. Properly installed and maintained, LVT provides decades of performance across all commercial segments.

3.2 Key Selection Attributes
Armstrong Luxury Flooring offers unique visuals, exceptional durability and easy cleanability. Designed for application over concrete, terrazzo, and other dry, structurally sound monolithic subfloors on all grade levels Armstrong Luxury Flooring will provide decades of performance. All Armstrong Luxury Flooring products are FloorScore® certified and are tested and comply with the requirements of the California Department of Public Health Standard Method for the Testing & Evaluation of VOC Emissions (CDPH V1.1., 2010).

5.0 Material Content

5.1 Definitions

- **Finish** – A factory applied UV-cured layer for low maintenance.
- **Wear Layer** – A clear vinyl layer that protects the design and improves durability.
- **Printed Layer** – A printed vinyl layer for beautiful designs.
- **Base Layer** – A limestone base with a vinyl binder for added durability.
- **Adhesive** – A field applied substance used to fasten the LVT to the subfloor.

Figure 1. Composition of Installed Luxury Flooring

5.2 Production of Main Materials

- **Calcium Carbonate** (Limestone) – An abundant mineral used as an inert filler.
- **Polyvinyl Chloride (PVC)** – A synthetic resin made from the polymerization of vinyl chloride.
- **Plasticizer** – Makes vinyl soft and flexible.
- **Stabilizer** – Processing aid that prevents material degradation due to heat and light.

5.2 Production of Luxury Flooring

Figure 2. Process for Manufacturing Luxury Flooring

Luxury Flooring is floor tile and planks used in residential and commercial flooring applications and is comprised mostly of limestone in a vinyl binder matrix. The manufacturing process involves the hot mixing of the raw materials milled and calendered into a hot sheet which is then laminated with different layers by a hot press machine. The sheet is coated and then slowly cooled or annealed to make it stronger, before being cut into tiles.
5.3 Health, Safety, and Environmental Aspects During Production

Armstrong Flooring has a comprehensive Environmental, Health, and Safety Management Program. Risk reduction begins in the product design process. All products go through a safety, health, and environmental review prior to sale. Armstrong Flooring also has a long standing commitment to the safety and health of all our employees. The company’s Safety Management Program is considered to be World Class. Our OSHA recordable incident rate is below 1.0, meaning there is less than one injury per 100 employees per year. All employees view safety as a key responsibility of their jobs. In 2010, Armstrong Flooring was named one of “America’s Safest Companies” by EHS Today.

Armstrong is equally committed to reducing our environmental impact. As with safety goals, each manufacturing facility has annual environmental plans, tailored to meet goals on energy, water, and waste reduction. Armstrong is a registered member with The Climate Registry. This means the company gets third-party verification of our global greenhouse gas (GHG) inventories, which are then made publicly available. As part of this effort, the cumulative energy usage by our facilities is reported in the Armstrong Climate Registry certification.

6.0 Installation of Luxury Flooring

6.1 Installation Recommendations

LVT must be installed in accordance with the current edition of the Armstrong Flooring Guaranteed Installation Systems manual, F-5061. This comprehensive guide to flooring installation provides all the information needed to properly install Armstrong Luxury Flooring and ensure it will look great and perform exactly as it should. You can reference this document at: https://www.armstrongflooring.com/commercial/en-us/resources/guaranteed-installations-systems-manual-F-5061.html

6.2 Health, Safety, and Environmental Aspects During Installation

There are no recognized systemic hazards associated with installing LVT flooring.

6.3 Waste

Installation waste is minimized by the modular aspect of the LVT flooring. A conservative 3% waste factor was assumed on-site during construction. This value is based on historic internal studies which have documented the quantity of scrap that is generated at the job site due to needed border cuts, penetrations, or installer mistakes. For this study it is assumed that all of the on-site scrap material will be sent to a landfill located within 50 miles of the job site.

6.4 Packaging

Armstrong Luxury Flooring is packaged in a recyclable corrugated box. Wooden pallets are used to protect unit loads during shipping.
7.0 Use Stage

For this study, it was assumed that LVT would last 30 years and therefore would need to be replaced 2 times over the building’s useful life if properly installed and maintained. The useful life indicated in the PCR for flooring is 60 years. Recommended maintenance practices are provided in the Armstrong Flooring Installation Guide and required as part of the warranty. Warranty details can be found at ArmstrongFlooring.com/ commflooringna/technical-downloadcenter. asp. For LVT, the recommended maintenance is representative of medium intensity maintenance, as shown in Table 5 and Figure 3. Because maintenance procedures often vary depending on the building owner’s maintenance practices, level of use, and traffic conditions, Table 5 provides low, medium and high maintenance scenarios. The normalized environmental impacts associated with these hypothetical scenarios are shown in Figure 3. The low intensity maintenance scenario results in lower environmental impacts. For example, less scrubbing means less water consumption and a lower eutrophication potential.

Table 5. Estimated Maintenance Intensity for Luxury Flooring

Figure 3. LCA Results for Estimated Maintenance Intensity (1 Year)

7.1 Cleaning and Maintenance

Recommended cleaning and maintenance can be found in Armstrong Flooring Installation and Maintenance Guides: ArmstrongFlooring.com/pdbupimages/197965.pdf

7.2 Health Aspects During Usage

All Armstrong Luxury Flooring products are FloorScore® certified and are tested and comply with the requirements of the California Department of Public Health Standard Method for the Testing & Evaluation of VOC Emissions (CDPH V1.1., 2010).
8.0 Extraordinary Effects

8.1 Fire Performance
Luxury Flooring demonstrates the following fire performance:

- Class 1 when tested in accordance with ASTM E 648/NFPA 253, Standard Test Method for Critical Radiant Flux
- Meets 450 or less when tested in accordance with ASTM E 662/NFPA 258, Standard Test Method for Smoke Density
- Flame Spread Index – 85 and Smoke Developed Index 385 or less when tested in accordance with CAN/ULC S102.2, Standard Test Method for Flame Spread Rating and Smoke Development

8.2 Insulation Value
R-value = 0.07 [ft² F h/Btu] R-value = 0.013 [m² K/W]

9.0 End of Life Stage

9.1 Disposal
Disposal in municipal landfill or commercial incineration facilities is permissible and should be done in accordance with local, state, and federal regulations.

10.0 Life Cycle Assessment
This study provides life cycle inventory and environmental impacts relevant to Armstrong Flooring systems. This LCA was conducted to 1) better understand the environmental impacts of the life cycle of flooring systems; 2) learn how the impacts of raw material selection, product formulation, and manufacturing process influence the life cycle impacts of flooring systems, and 3) use innovation to drive reduction in the product.

The methods for conducting the life cycle assessments, upon which this EPD is based, were consistent with ISO 14040 and 14044. This report is intended to fulfill the reporting requirements in Section 5 of ISO 14044 and the Product Category Rules for Flooring: Carpet, Resilient, Laminate, Ceramic, Wood.

10.1 Information on the Product System Definition and Modeling of the Life Cycle
The functional unit for this EPD is 1 m² of LVT for use over 1 year.

Flooring System View: In order to understand the complete view of a flooring system, life cycle information is included for the total flooring system based on 1 square meter (m²) view. This includes the flooring tile, adhesives and finishes applied during the use stage.
10.0 Life Cycle Assessment (continued)

System Boundaries:
The system boundaries studied as part of this life cycle assessment include extraction of primary materials, raw materials manufacture, flooring panel production, installation and end of life.

The phases below outline a “cradle-to-grave” life cycle assessment for flooring tiles (Figure 4).

Figure 4. Life cycle phases included for the Luxury Flooring in study:

![Figure 4. Life cycle phases included for the Luxury Flooring in study](image)

Figure 5. Life cycle phases included in the adhesive and polish used during the use stage of the study:

![Figure 5. Life cycle phases included in the adhesive and polish used during the use stage of the study](image)

As Shown in Figures 4 and 5, the Cradle-to-Grave Assessment Includes:
- Production including raw material and packaging materials for Luxury Flooring.
- Installation includes raw material for adhesive and polish
- Transportation of raw materials to the manufacturing facility
- Manufacturing of the tiles at the manufacturing facility
- Packaging of finished products including energy to operate packaging equipment
- Transportation from manufacturing facility to distribution centers, retailers, and job site (assumed to be 500 miles by truck)
- Use phase covers a useful life of 60 years as required by the PCR and includes the transportation and installation of the system including adhesive, polish and maintenance
- End of life includes landfill disposal of LVT with assumed 50 miles by truck

The Cradle-to-Grave Assessment Excludes:
- Overhead energy usage (heating, lighting) of manufacturing facilities
- Maintenance and operation of support equipment
10.0 Life Cycle Assessment (continued)

Assumptions:
Armstrong Flooring began conducting life cycle assessments in 2006 and completed a baseline LCA of key flooring products in 2012.
This map shows the location of the Armstrong Luxury Flooring manufacturing facility. Transportation emissions and fuels throughout the life cycle phases are included. All transportation associated with raw materials reflects the actual modes of transportation and mileage. Disposal transportation at end of life is assumed to be 50 miles.

Cutoff Criteria:
The cutoff criteria for the study are as follows:
- Mass – If a flow is less than 1% of the cumulative mass of the model, it is excluded, providing its environmental relevance is not a concern.
- Energy – If a flow is less than 1% of the cumulative energy of the model, it is excluded, providing its environmental relevance is not a concern.
- Environmental relevance – If a flow meets the above criteria for exclusion, yet is believed to potentially have a significant environmental impact, it is included.

Data Quality:
The LCA model was created using the GaBi 6 Software system for life cycle engineering, developed by PE INTERNATIONAL GmbH. The GaBi database provides the life cycle inventory data for several of the raw and process materials obtained from the background system. The data quality is considered to be good to high quality. With the exception of supplier specific data, all other relevant background data was taken from the GaBi database software. No data set was over 10 years old.
All gate-to-gate, primary foreground data was collected for the flooring manufacturing process. This foreground data was from annual production for the year of 2011. Background data was collected from suppliers or generic data was used. When generic data was used, it was verified and triangulated against several sources.

Allocation:
- Co-Product Allocation – No co-product allocation occurs in the product system.
- Multi-Input Processes Allocation – No multi-input allocation occurs in the product system.
- Reuse, Recycling, and Recovery Allocation – The cut-off allocation approach is adopted in the case of any recycled content, which is assumed to enter the system burden-free. Only environmental impacts from the point of recovery and forward (e.g., collection, sorting, processing, etc.) are considered.
Product and packaging waste is modeled as being disposed in a landfill rather than incinerated or recycled. Plastic and other construction waste is assumed to be inert in landfills so no system expansion or allocation is necessary as landfill gas is not produced. In the case of bio-based packaging waste disposed during installation, landfill gas from the decomposition of this waste is assumed to be collected and used to produce electricity. It is assumed that this recovered energy offsets energy produced by the US average grid.
10.0 Life Cycle Assessment (continued)

10.2 Results of the Life Cycle Assessment

The LCA results are documented separately for the following stages:

1. Sourcing/Extraction
2. Production
3. Installation
4. Use Phase
5. End of Life

Table 6 shows the results for 1 m² of Luxury Flooring installed and maintained for one year.

Table 6. LCA of LVT for 1 m² of installed LVT flooring including medium intensity maintenance for 1 year

10.0 Life Cycle Assessment (continued)

Waste and Water Consumption

The waste shown in Table 10 accounts for the waste generated at Armstrong Flooring manufacturing facilities ("Production"). The "Use" phase waste accounts for the disposal of the packaging and scrap materials generated during installation; the quantity of flooring disposed of following removal from a building is shown in the "End of Life" phase. These waste values do not include the waste generated in the upstream processes. Other waste categories specified in the PCR were excluded due to data quality.

The life cycle of this product consumes water during production while producing non-hazardous wastes. The quantities are separated into contribution per life cycle stage as shown in Table 10 for 1 m² of Luxury Flooring.

10.3 Interpretation of Life Cycle Assessment

From the results of the flooring system life cycle covered in this study, it was concluded that the flooring manufacturing process and raw materials – specifically, PVC in the binder – have the greatest impact on Primary Energy Demand (PED) and "carbon footprint" (represented by Global Warming Potential [GWP]).

As shown in Figure 6, End of Life impacts are minimal when compared to other life cycle stages.

10.4 Flooring Impacts:

As shown in Table 6 on page 12, the majority of the environmental impacts for this product occurs during the extraction and processing of raw materials detailed in the Production Stage. For most flooring, the opportunity for reduction is in the manufacturing process as well as reductions associated with raw materials.

10.5 Use Stage:

The use stage is defined in the PCR at 60 years and this is what was used in the LCA. The assumption is that the flooring requires normal maintenance as shown in Table 5. Additional details regarding the assumptions and details of how the use phase was modeled in this study can be found in Section 7. Impacts associated with the Use Stage vary depending on the building owner’s maintenance practices, level of use, and traffic conditions. Figure 5 provides details of three (3) maintenance scenarios and the impacts resulting from the scenarios are provided in Table 8. The low intensity maintenance scenario results in lower environmental impacts. For example, less scrubbing means less water consumption and a lower eutrophication potential.

10.6 End of Life Impacts:

End of Life Impacts associated with landfilling of Luxury Flooring flooring had the greatest impact on eutrophication and acidification potential.
11.0 Additional Information, Evidence, Test Certificates

11.1 VOC Emissions
All Armstrong Luxury Flooring products are FloorScore® certified and are tested and comply with the requirements of the California Department of Public Health Standard Method for the Testing & Evaluation of VOC Emissions (CDPH V1.1., 2010).

13.0 Third Party Evaluations
- Certificate of Compliance for VOC Emissions: Berkeley Analytical and FloorScore
- Climate Registry certification of our greenhouse gas (GHG) inventories
14.0 Quality Assurance

Armstrong Flooring has a robust internal Quality Assurance process that is based on industry-accepted best practices and is led by a team of quality professionals who have been certified by the American Society for Quality. The process involves several hundred different measures made throughout the manufacturing processes. All Armstrong Luxury Flooring is manufactured in ISO 9001 certified plants.

15.1 Definitions

GaBi 6.3 – LCA Modeling Software

CML-2010 – an impact assessment tool developed by the Center of Environmental Science of Leiden University (CML). The CML methodology groups the LCI results into midpoint categories, according to themes. These themes are common mechanisms (e.g. climate change) or groupings. The impact categories used in this report are Global Warming Potential (GWP), Acidification Potential (AP), Eutrophication Potential (EP), Ozone Depletion Potential (ODP), Photochemical Ozone Creation Potential (POCP), Abiotic Depletion Elements (ADE) and Abiotic Depletion Fossil (ADF).
